EDUCATION

Dr. A.P.J. Abdul Kalam Technical University

Bachelor of Technology (B.Tech), Computer Science

Expected Graduation: 2028

Relevant Coursework: Data Structures & Algorithms, Web Development, Full-Stack Development

TECHNICAL SKILLS

Languages: C++, Python

Web & Full-Stack: Next.js, Full-Stack Web Development, REST APIs

Backend & Database: Supabase (PostgreSQL, Row-Level Security, Storage), Authentication & JWT-based Access Control

Infrastructure & Tools: Vercel (CI/CD & Deployment), Git & GitHub, DNS & Domain Configuration, AI-Assisted Development (Antigravity)

Integrations: Razorpay Payment Gateway (order creation, signature verification), Resend (transactional email, domain authentication), Google Search Console & Schema.org structured data

PROJECTS

The Shadow Bridge — Full-Stack Service Marketplace Platform

Live at theshadowbridge.com | Next.js, Supabase, Vercel, Razorpay, Resend

- Independently architected and shipped a production full-stack platform connecting families with special-needs education professionals (Shadow Teachers, Home Tutors, and licensed Therapists) across 5 Indian cities, using an AI-assisted development workflow to design, build, and iterate on 100% of the product end-to-end.
- Onboarded and managed data for 40+ real users (parents and education professionals) through the platform's live registration and consultation-booking system, backed by a PostgreSQL database across multiple normalized tables.
- Designed a multi-stage, server-side gated user workflow (consultation booking → admin verification → registration → payment) spanning 3 independent registration flows, with status validation enforced at the API layer to prevent unauthorized step-skipping.
- Integrated Razorpay for live payment processing, implementing server-side order creation and HMAC-SHA256 signature verification to securely handle real financial transactions across multiple fee tiers.
- Built a role-based admin dashboard with JWT-authenticated access control, real-time CRUD record management, and a custom rule-based location-matching engine that automatically surfaces relevant candidates from PostgreSQL data based on geographic proximity.
- Configured transactional email infrastructure (Resend) with a fully authenticated custom domain (SPF/DKIM), driving automated notifications across the entire user lifecycle.
- Implemented technical SEO infrastructure — dynamic sitemap generation, robots.txt, per-page metadata, and Schema.org structured data — and configured Google Search Console, growing indexed page coverage across the live domain.
- Managed the complete deployment pipeline via GitHub and Vercel, including custom domain and DNS configuration, environment-based secret management, and production incident debugging across the database, payment, and email layers.
